## **Arrays and Strings in C**

Md. Aminul Islam Shazid

#### Outline

- 1 Introduction to Arrays
- 2 Multidimensional Arrays
- 3 Strings in C
- 4 Summary
- **5** Exercises

# Introduction to Arrays

#### What is an Array?

- An array is a collection of elements of the same type stored in contiguous memory.
- Each element is accessed by an **index** (zero-based in C, meaning that the first element is at index 0): arr[0], arr[1], ...
- Example: list of student marks
- Arrays let us group related values under one name

#### 1D Array: Declaration and Initialization

#### **Declaration:**

```
int arr[5];  // declares an array of 5 integers
```

#### **Declaration and Initialization:**

```
int a[5] = {10, 20, 30, 40, 50};
int b[] = {1, 2, 3};  // size inferred: 3
```

#### **Accessing Individual Elements**

- Use square brackets with index: arr[index].
- Example: arr[2] accesses the third element.

#### **Example: print elements**

```
#include <stdio.h>
int main() {
   int a[5] = {10, 20, 30, 40, 50};
   printf("%d\n", a[2]); // prints 30
   return 0;
}
```

#### Sample Output:

30

2

#### **Example: Take User Input Into an Array**

```
#include <stdio.h>
 2
   int main() {
       int n, i;
       printf("How many numbers? ");
       scanf("%d", &n);
       int arr[100]; // assume max 100 for simplicity
8
       for (i = 0; i < n; i++) {
           scanf("%d", &arr[i]);
10
       for (i = 0; i < n; i++) { // printing the values
11
           printf("arr[%d] = %d\n", i, arr[i]);
12
13
14
```

#### **Example: Summing the Elements of an Array**

```
#include <stdio.h>
2
3
   int main() {
        int i, sum = 0, arr[5] = \{10, 20, 30, 40, 50\};
5
       for (i = 0; i < 5; i++){}
            sum += arr[i]:
8
        printf("Sum = %d\n", sum);
10
```

#### **Example: Reverse an Array**

```
#include <stdio.h>
   int main() {
        int n = 5, i;
        int a[] = \{1,2,3,4,5\};
        for (i = 0; i < n/2; i++) {
            int tmp = a[i];
            a[i] = a[n-1-i];
            a[n-1-i] = tmp:
10
        for (i = 0; i < n; i++){}
11
            printf("%d ", a[i]);
12
13
        printf("\n");
14
15
```

**Multidimensional Arrays** 

#### **Multidimensional Array**

- An array with more than one dimension
- Real-life analogies:
  - 2D: matricx or spreadsheet (rows and columns), indices are written as arr[row][col]
  - 3D: a stack of matrices
- C supports arrays with any number of dimensions

#### 2D Array: Declaration and Initialization

#### **Example: Accessing Values in 2D Arrays**

- Access element at row r, column c by mat[r][c].
- Example: mat[1][2] refers to second row, third column.

#### Example: print a 2×3 matrix

```
#include <stdio.h>

int main(){
   int mat[2][3] = {{1,2,3},{4,5,6}};
   printf("%d\n", mat[1][2]); // prints 6
   return 0;
}
```

## **Example: Input and Print a 2D Array**

```
#include <stdio.h>
   int main() {
        int r = 2, c = 3, i, j, mat[2][3];
 5
        printf("Please input a 2 by 3 matrix:\n");
       for (i = 0; i < r; i++){
            for (j = 0; j < c; j++){
                scanf("%d", &mat[i][i]);
10
11
12
13
        printf("\nYou entered:\n");
14
```

Continued in next slide

#### Example: Input and Print a 2D Array (cont.)

```
printf("\nYou entered:\n");

for (i = 0; i < r; i++) {
    for (j = 0; j < c; j++){
        printf("%d ", mat[i][j]);
     }

printf("\n");
}</pre>
```

#### 3D and Higher Dimensions

- A 3D array int arr[2][3][4]; can be thought of as 2 blocks, each block is a 3×4 matrix
- Real-life: for example, block x row x column measurements (temperature map over multiple days)
- Indexing: a[block][row][col]

**Strings in C** 

#### What is a String in C?

- In C, a string is an array of char terminated by the null character
   '\0'
- Example: char s[] = "hello"; actually creates 6 chars: 'h','e','l','o','\0'
- Strings are manipulated through arrays and standard library functions in <string.h>
- You can access individual characters with s[i]

#### **Declare and Initialize Strings**

#### **Reading Strings from User**

- Avoid gets() (unsafe). Use fgets() or scanf("%s", ...)
- scanf("%s", s); reads until whitespace, does not read spaces
- fgets(s, size, stdin); reads a whole line (including spaces)
- However, the string from fgets() includes newline (\n)
- May want to trim this newline (trimming it, is often not required, depends on use case)

#### Example: String Input Using scanf()

```
#include <stdio.h>
int main(){
    char username[20];
    printf("Enter your name: ");
    scanf("%s", username);
    printf("Good day to you, %s!", username);
}
```

Note that in scanf(), we provided username as the second argument and not &username.

This is because username itself holds the memory address of the character array.

Recall that the &var returns the memory address of the variable named var.

#### Example: String Input Using fgets()

```
#include <stdio.h>
   #include <string.h>
   int main() {
       char s[100];
       printf("Enter a line: ");
       fgets(s, sizeof(s), stdin);
 8
       // remove trailing newline
       // search for "\n" and replace with "\0"
10
       s[strcspn(s, "\n")] = '\0';
11
       printf("You wrote: \%s\n", s);
12
       return 0;
13
```

#### Example: String Input Using fgets() (cont.)

```
// remove trailing newline
// search for "\n" and replace with "\0"
s[strcspn(s, "\n")] = '\0';
```

In the above code,  $strcspn(s, "\n")$  searches for and returns the index of the newline character ("\n") in the string named s.

 $s[strcspn(s, "\n")] = '\0';$  replaces the newline character with the null terminator character ("\0).

#### Common String Functions (from <string.h>)

- strlen(s) length of string (not counting '\0')
- strcmp(s1, s2) compare strings (returns 0 if equal)
- strcpy(dest, src) copy string
- strcat(dest, src) concatenate

## Example: Comparing Two Strings: strcmp()

```
#include <stdio.h>
   #include <strina.h>
   int main() {
       char a[20], b[20];
       scanf("%s", a):
       scanf("%s", b);
       if (strcmp(a, b) == 0)
            printf("Same\n");
10
        else
            printf("Not same\n");
11
        return 0;
12
13
```

strcmp() returns 0 if the two strings are same.

#### Example: Copying a String: strcpy()

```
#include <stdio.h>
   #include <strina.h>
3
   int main() {
       char a[20], b[20];
5
       scanf("%s", a);
       // copying the contents of a into b:
       strcpv(b, a); // 2nd argument is the source
       printf("%s", b);
10
       return 0:
11
12
```

#### **Example: Concatenate Strings (strcat)**

```
#include <stdio.h>
   #include <string.h>
3
   int main() {
       char a[] = "Hello";
       char b[] = " World";
       strcat(a, b);
       printf("\%s\n", a); // prints "Hello World"
       return 0:
10
```

## Summary

#### Summary

- Array: contiguous collection of same-type elements, accessed by indices arr[i]
- 1D/2D/3D: use arr[i], arr[i][j], arr[i][j][k] respectively
- Strings: arrays of char ending with '\0'. Use <string.h> functions for convenience
- Input: scanf or fgets (preferred for whole lines)

#### **Array Variable and Memory**

- Important note: In many contexts (for example, when passing to a function), the array name (say, arr) is a pointer to the first element (details on pointers in upcoming lectures)
- Meaning that, arr actually holds the memory address in which the first element of the array is stored
- To summarize: the array name points to a contiguous block of memory starting at the first element of the array

**Exercises** 

#### **Exercises**

- Write a program to read n integers into an array and print them in reverse order.
- Write a program to find the maximum and minimum values in an integer array.
- Write a program to remove duplicate elements from a small integer array (keep first occurrences).
- Write a program to multiply two 2×2 matrices and print the result.
- Write a program to read a line of text and print its length (without using strlen).

#### **Exercises (cont.)**

- Write a program to check if a given string is a palindrome (ignore case and spaces).
- Write a program to count frequency of each digit (0-9) in an array of integers.
- Write a program to concatenate two strings without using strcat.
- Write a program to rotate the elements of an array to the right by k positions.
- Write a program to read a 3D array of size  $2 \times 2 \times 2$  and compute the sum of all elements.
